Bing

The maturity of an investment refers to the date on which the investment ends, often triggering the repayment of a loan or bond, the payment of a commodity or cash payment, or some other payment or settlement term [1]. It is a primary consideration for investors since it has to match their investment horizon, which can range from as short as a few days to decades, depending on how long the investor intends to hold the investment in order to achieve their objectives [1]. The maturity date for loans and other debt can change repeatedly throughout the lifetime of a loan, should a borrower renew the loan, default, incur higher interest fees, or pay off the total debt early [1].

I hope this helps. Is there anything else I can help you with?
